This report includes the most commonly used Forest Inventory and Analysis statistics. Additional forest resource data can be provided to interested users. Persons requesting additional information from the raw inventory data are expected to pay the retrieval costs. These costs range from less than \$100 for a relatively simple request to \$2,000 for a complex retrieval involving the services of a Forest Inventory and Analysis computer programmer. Requests will be filled so as to minimize the impact on the Forest Inventory and Analysis Work Unit.

Requests for information may be directed to:

FOREWORD

The fifth inventory of Minnesota was directed by Neal P. Kingsley, Forest Inventory and Analysis (FIA) project leader. David F. Heinzen, supervisor of the Minnesota Department of Natural Resource's (DNR) Resource Assessment Analysis Program, was responsible for overseeing all DNR personnel and contract field crews. Jerold T. Hahn and Mark H. Hansen were responsible for inventory design. Arnold (Jerry) Ostrom supervised the FIA field crews, which were responsible for collecting field data in the Central Hardwood and Prairie Survey Units and in part of Itasca County. Steve Flackey of the Minnesota DNR supervised the field crews that collected data in the Aspen-Birch and Northern Pine Survey Units. Elizabeth C. Collins supervised FIA's photo interpretation staff, and George Deegan of the Minnesota DNR was responsible for supervising State photo interpreters.

FIA field crew members:

Nancy Ady, Karen Brand, Becky Bryan, John Bryan, Michael Burns, Paul Castillo, Mark Dille, John DuPlissis, Loren Elde, Jay Flynn, Mark Hamel, Cheri Hartless, Patrick Hartless, Robert Haukereid, Douglas Hecker, Glenda Hefty, Gary Inhelder, Peter Koehler, Gary Larson, William Nelson, William Peters, Ron Piva, Lois Poppert, Loren Poppert, Ed Rumbold, Nicholas Severson, Jerry Van Cleve, Linda Weidel, Dan Wendt

FIA field crew clerk typist:

Monica Van Cleve

Minnesota DNR field crew members:

Ben Anderson, Dana Carlson, Johnathon Carter, Marty Cassellius, Gary Cummings, John Dowd, Steve Flackey, Steve Gallay, Harley Hanson, Mark Holien, Bob Heisel, Bill Julson, Edward Koski, Peter Lindemanis, Larry Long, Rob Maki, Dave Marshall, Doug Miedtke, Albert Mitchell, Ralph Niemi, Terry Novak, Dick Peterson, Greg Russell, Randy Schindle, Bruce Schoenenberg, Jeff Sirjord, Bill Schuster, Scott Seeley, Craig Sterle, Greg Vollahaber

Minnesota DNR field crew clerk typist:

Peggy Nelson

Contracting field crew members:

Sue Abrahamson, Brian Allen, John Allen, Howard Arch, Dave Arends, Barbara Knight, David Banta, Rick Barber, Rick Barta, Michael Baumer, Duran Bjorklund, Carl Brummard, Tom Buescher, Scott Bunney, Scott Burns, John Calgaro, Mark Carter, Bob Cavallaro, Pat Churack, Joe Clark, Richard Cooper, Jim Enblom, Tom Erickson, Rob Eul, Tim Eul, Jay Flynn, Jeff Fossen, Joel Fyock, Bill Giblin, John Gray, Stan Grossman, Bill Hamm, Don Hoppe, Scott Horton, Robert Hurray, Ken Jaeger, Dale Johnson, Rosemary Johnson, Michael Lea, Greg Lenz, Bill Loscheider, Mike Kaiser, Bob Karr, David Kasper, Joe McDonald, Craig Maly, Ronald Meyer, John Miller, George Niskala, Dan Peterson, Phil Polzer, Michael Rath, Stan Ricker, Ron Romback, Karen Ruder, Don Small, John Schaff, Nick Severson, Michael Steinfeldt, Kevin Sturgeski, Jan Tennant, Patricia Topley, Dan Wendt, Bill Wilson

Training provided by Minnesota DNR disease and insect specialists increased the accuracy of tree class determination. These classifications now more accurately reflect the utilization of aspen and several other species. Training of field crews was

done by Michael Albers, Jana Albers, and Ed Hayes. Tom Eiber and Alan Jones were responsible for the development of standardized disease and damage codes.

FIA photo interpreters:

Rose Berg, Elizabeth Collins, Julie Fleming, Dale Gormanson, Mark Johnson, Barbara Knight, Leo Larkin, Jay Solomakos, Mark Springen

Minnesota DNR photo interpreters:

Marty Casselius, George Deegan, John Falkner, Steve Flackey, Valiree Hanson, Craig Mellin, Greg Russell, Scott Seeley

Patrick D. Miles and Mark H. Hansen were responsible for generating area, volume, growth, and removals tables. William (Brad) Smith and Ronald L. Hackett collected and compiled data on timber product outputs and timber removals. Pat Murray and Jay Solomakos edited the data, and Mary Jo Resendez prepared the tables for printing.

Mary Jean Hanson and Daniel S. Goodman provided administrative and secretarial support. Computer support was provided by Gerhard K. Raile.

Forest Inventory and Analysis (FIA) is a continuing endeavor as mandated by the Renewable Resources Research Act of 1978. Prior inventories were mandated by the McSweeney-McNary Forest Research Act of 1928. The objective of FIA is to periodically inventory the Nation's forest land to determine its extent, condition, volume of timber, growth, and removals. Up-to-date resource information is essential to frame forest policies and programs. USDA Forest Service regional experiment stations are responsible for conducting these inventories and publishing summary reports for individual States. The North Central Forest Experiment Station is responsible for forest inventory and analysis in Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, South Dakota, and Wisconsin.

Fieldwork for the fifth Minnesota forest inventory was begun in April 1986 and completed in February 1991. Reports of the four previous inventories of Minnesota's timber resource are dated 1936, 1953, 1962, and 1977.

More accurate survey information was obtained during this survey than otherwise would have been feasible because of intensified field sampling. Such sampling was made possible through the cooperation and assistance of the Minnesota DNR. Data for the Aspen-Birch and Northern Pine Survey Units were collected by contract crews hired and supervised by the Minnesota DNR. The DNR installed several hundred additional plots on national forest land. These efforts increased the sampling intensity on national forest lands from a single intensity level to the triple intensity level of the rest of the State. Data for the Central Hardwood and Prairie Units were collected by FIA. To aid in determining current timber removals, the Minnesota DNR also surveyed primary wood-using plants in the State.

Aerial photos used in the forest inventory were purchased by the State from the U.S. Geological Survey. This photography was from the National High Altitude Photography program (NHAP). In addition, the Minnesota DNR provided 35mm true color prints at a scale of 1:15,840 of all of the 1977 plot locations for disturbance detection.

Minnesota Forest Statistics, 1990

Patrick D. Miles and Chung M. Chen

HIGHLIGHTS

NOTE: Data from new forest inventories are often compared with data from earlier inventories to determine trends in forest resources. However, for the comparisons to be valid, the procedures used in the two inventories must be similar. As a result of our ongoing efforts to improve the efficiency and reliability of the inventory, several changes in procedures and definitions have occurred since the last Minnesota inventory in 1977. Because some of these changes will make it inappropriate to directly compare the 1990 data with those published for 1977, data from the 1977 inventory have been reprocessed using the 1990 procedures. Please refer to the section labeled "Comparing Minnesota's Fifth Inventory With the Fourth Inventory" for more details.

General

Minnesota is divided into four survey units (fig. 1), and separate statistical reports have been published for each unit. Unit boundaries roughly align with the three broad ecoregions in Minnesota. The Aspen-Birch and Northern Pine Survey Units in the north contain most of the State's boreal forest. The Central Hardwoods Survey Unit in the southeast is dominated by hardwoods. And the Prairie Survey Unit in the west, once open prairie, is now nearly 85 percent cropland.

Patrick D. Miles, Programmer Analyst, received a bachelor's degree in forestry in 1981 and a master's degree in forest economics in 1984 from the University of Minnesota. He joined the Forest Service in 1984 and has been with the Forest Inventory and Analysis Unit since 1989.

Chung M. Chen, Senior Research Analyst for the Minnesota DNR, received a bachelor's degree in forestry from Taiwan National Chung-sing University, a master's degree from Yale, and a Ph.D. from the University of Minnesota.

The geology and soils of the northern two-thirds of the State are largely the result of glaciation. The flat area in the northwest corner of the State was once the basin of ancient Lake Agassiz. Bare bedrock and shallow soils in the northeast show the scars left by advancing and retreating glaciers. The sandy gravelly soils of parts of central Minnesota, along with potholes, drumlins, and moraines, are additional evidence of these recent geologic events. Southeastern Minnesota, largely untouched by glaciation, has a much older landscape. The valleys and bluffs in the southeast have been etched out over a much longer time period. Rivers, periodically filled to overflowing by glacial runoff, have carved valleys and bluffs from sedimentary layers deposited in ancient seas.

Forest Area

- The total land area of Minnesota is 51.0 million acres, of which 33 percent is forested. The area of all forest land in the State has increased by 0.7 percent since 1977 to 16.7 million acres. The current forest area includes 1.1 million acres of reserved forest land where harvesting is prohibited by statute or administrative designation. The largest area of reserved forest land (1.0 million acres) is in the Aspen-Birch Survey Unit, primarily the Boundary Waters Canoe Area Wilderness and Voyageurs National Park.
- There were 14,773,400 acres of timberland in the State in 1990, an 8.5-percent increase from 1977. Just over half of this increase came from the reclassification of unproductive forest land to timberland in 1990. Survey plots with a low site index (under 15 for northern white-cedar, 20 for black spruce and tamarack, and 25 for eastern redcedar; under 35 for all other species) were classified as unproductive forest land in 1977. Improved site index curves used in the 1990 survey placed many of these plots in the timberland category. The large increase in the black spruce and tamarack types in the

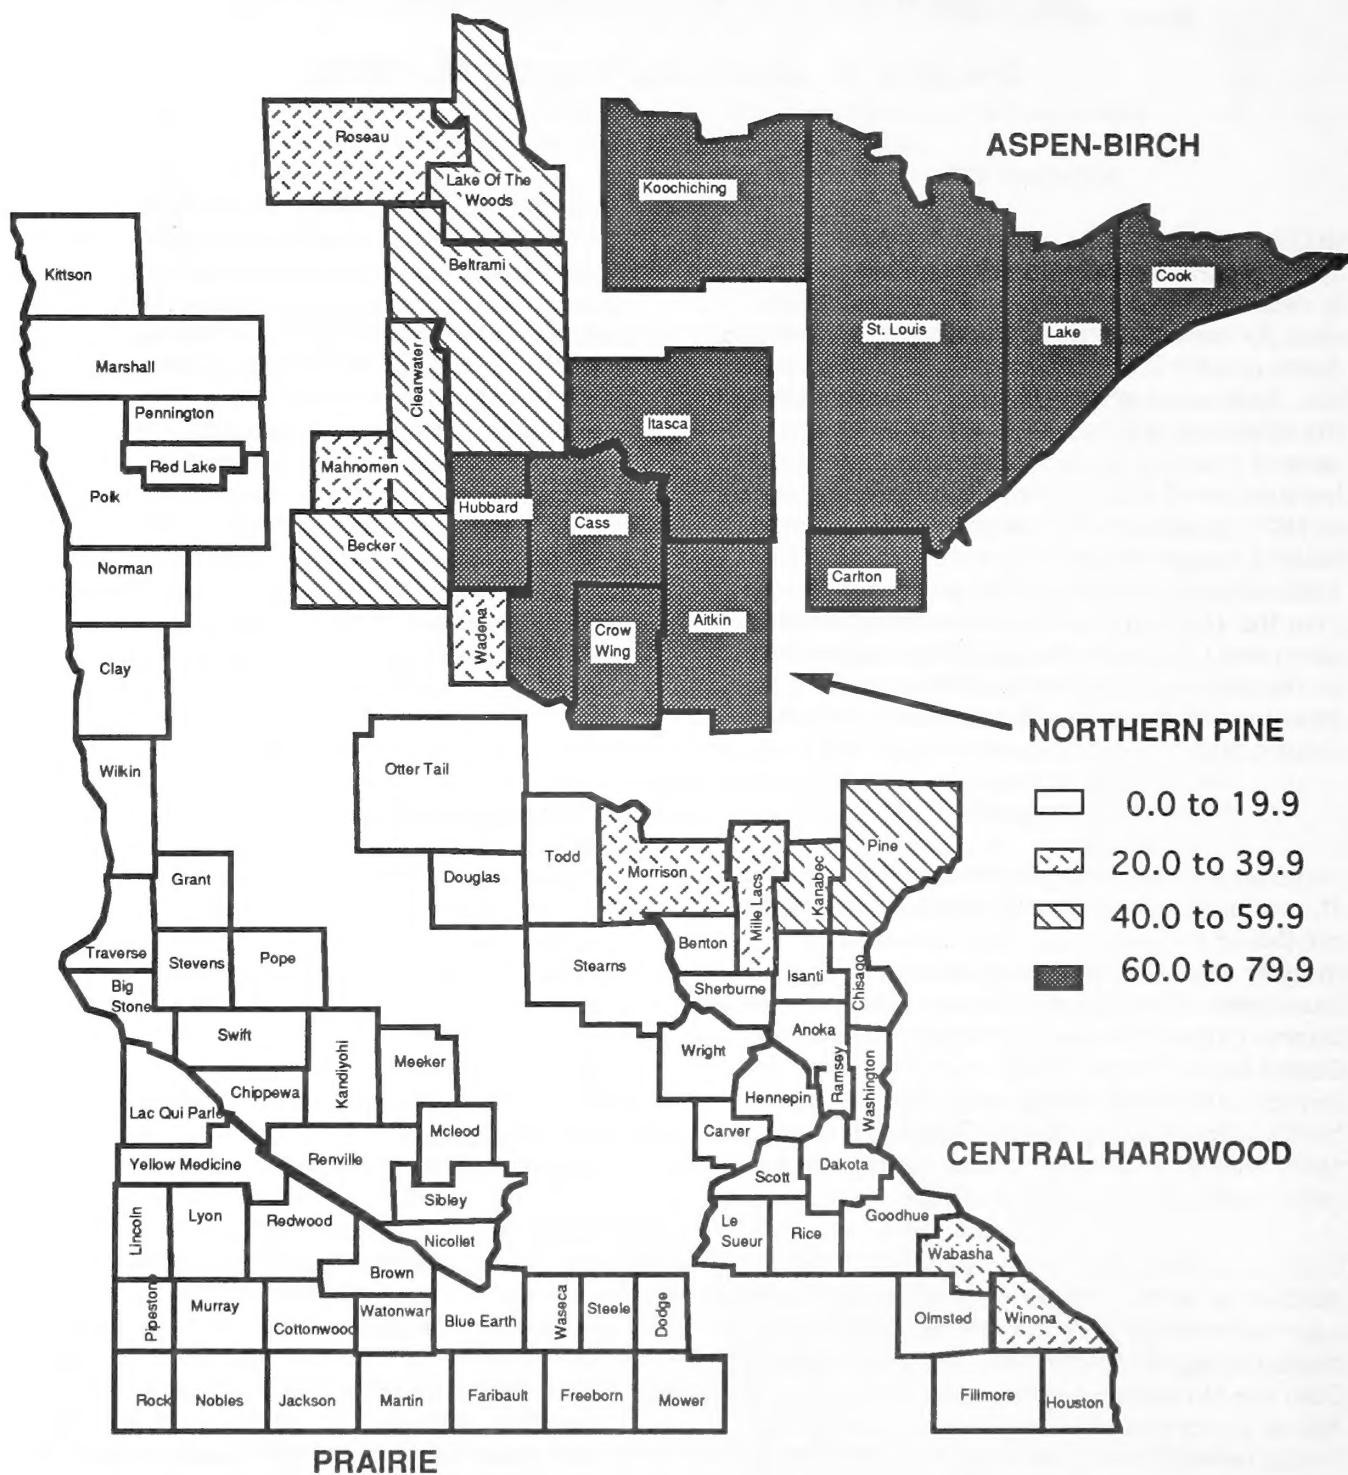

Figure 1.—Forest land as a percent of land area by county, Minnesota, 1990.

Aspen-Birch Unit is due mainly to these new site index curves. Another two-fifths of this increase can be attributed to the conversion of cropland or marshland to timberland.

- The highest concentration of timberland is in the northeastern Minnesota (fig. 1). Of the four units, the Aspen-Birch Unit has the highest percentage of area in timberland (68 percent). The Northern Pine Unit is second with 54 percent timberland followed by the Central Hardwood Unit with 19 percent and the Prairie Unit with only 3 percent. The highest concentration of forest industry (pulp, saw and fiberboard mills) is also in the north¹. The Central Hardwood Unit, with 64 percent of the State's oak-hickory forest type, also plays an important role in the State's timber economy. Forest areas in the Prairie Unit are widely scattered but are important for recreation, wildlife, and soil stabilization.
- State, county, and municipal governments administer 37.8 percent of the 14.8 million acres of timberland in Minnesota (fig. 2). Farmers and other private owners control 43.5 percent.
- The area of sawtimber stands increased from 26 percent of the timberland area in 1977 to 33 percent in 1990 as poletimber stands grew into the sawtimber size class. The proportion of area in sapling-seedling stands also increased by approximately 7 percent, from 23 percent of timberland area in 1977 to 30 percent in 1990. This increase is attributable to the harvesting and subsequent regeneration of sawtimber and poletimber stands.
- Stocking on timberland areas improved slightly between survey periods. In 1977 approximately 74 percent of timberland was moderately to well stocked. By 1990 this had increased to 78 percent.
- More than one-third of the timberland in Minnesota is in the aspen forest type (fig. 3), a

Figure 2.—Distribution of timberland by ownership, Minnesota, 1990.

proportion that remained relatively constant between the two surveys. The area in black spruce and northern white-cedar types has increased by 25 percent, and the area of tamarack has increased by more than 40 percent. These increases are due in large part to the reclassification of unproductive forest land to marginally productive land in 1990.

Figure 3.—Area of timberland in Minnesota by major forest type group, 1977 and 1990

¹ Smith, W. Brad; Dahlman, Rick. 1988. *Minnesota timber industry—an assessment of timber product output and use, 1988*. Resour. Bull. NC-127. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 61 p.

Number of Trees

- In 1990 there were more than 2 billion growing-stock trees 5 inches and larger in diameter in Minnesota, an increase of nearly 10 percent from that reported in 1977. The number of trees between 1 and 5 inches in diameter increased by 26 percent between 1977 (4.4 billion) and 1990 (5.6 billion).

Volume

- Growing-stock volume increased from 12.4 billion cubic feet in 1977 to 15.1 billion cubic feet in 1990—a gain of 22 percent (fig. 4). During the same period, sawtimber volume increased from 24.3 billion board feet to 34.8 billion board feet, up 43 percent.
- Growing-stock volume per acre increased from 909 cubic feet to 1,022 cubic feet between inventories. During the same period, sawtimber volume per acre increased from 1,787 to 2,356 board feet.

Figure 4.—Growing-stock volume by major forest type groups, Minnesota, 1977 and 1990.

- Fifty-one percent of the growing-stock volume in Minnesota is on public lands (fig. 5). State and local governments administer 36 percent, the Chippewa and Superior National Forests administer 14 percent, and other public agencies administer 2 percent. Private ownership of growing-stock volume is split between miscellaneous private owners (29 percent), farmers (15 percent), and forest industry (4 percent).

Figure 5.—Growing-stock volume by ownership group, Minnesota, 1990.

- Hardwoods comprise 69 percent of the growing-stock volume in Minnesota, or about 10.5 billion cubic feet. Aspen (quaking and bigtooth) is the largest component of hardwoods, totaling 4.1 billion cubic feet or 39.1 percent of hardwood volume (fig. 6). Softwoods account for the other 31 percent of total timber volume. Spruce and fir are the largest constituent at 43 percent of softwood volume.

Softwoods (4.634 Billion Cubic Feet)

Hardwoods (10.460 Billion Cubic Feet)

Figure 6.—Growing-stock volume by species group, Minnesota, 1990.

Timber Growth, Mortality, and Removals

- Annual growth, removals, and mortality are often reported as a percentage of the current inventory. Because of the 13 years between surveys, this can lead to deceptive results. As an example, average annual mortality of elm from 1977 to 1989 was 25.9 million cubic feet. Total volume of elm over that same period fell from 541.7 million cubic feet in 1977 to 268.1 million cubic feet in 1990. When average annual mortality of elm is expressed as a percentage of the 1990 inventory, the mortality rate is 9.7 percent, but when it is expressed as a percentage of the 1977 inventory, the mortality rate is 4.8 percent. If we assume that the mortality rate has been constant over the period, we would get a mortality rate of 5.3 percent per year. In short, average annual changes as a percent of the 1990 inventory are interesting for comparison purposes, but they should not be used for inferring future trends.
- Net annual growth of growing stock on timberland averaged 368.0 million cubic feet per year between 1977 and 1989, an average of 24.9 cubic feet of growth per acre per year, or 2.4 percent of the 1990 inventory.

- Average net annual growth for softwoods was 112.7 million cubic feet during the period from 1977 to 1989, or 2.4 percent of the 1990 softwood inventory (fig. 7). Hardwood average net annual growth was 255.3 million cubic feet—2.4 percent of the 1990 hardwood inventory. Almost half of the hardwood growth was in aspen. Average annual growth of aspen was 123.4 million cubic feet, or 3.0 percent of inventory. Other hardwoods had an average annual growth of 131.9 million cubic feet—2.1 percent of the 1990 inventory.
- Growing-stock mortality on timberland averaged 219.2 million cubic feet per year from 1977 to 1989, an average of 1.5 percent of the 1990 inventory.
- Annual removals of growing stock from timberland during the period from 1977 to 1989 averaged 210.1 million cubic feet. Softwood removals averaged 54.9 million cubic feet per year (48.7 percent of growth) (fig. 7). Average annual aspen removals was 85.8 million cubic feet (69.6 percent of growth) over this period. Other hardwood removals averaged 69.3 million cubic feet (52.5 percent of growth).

Figure 7.—Average annual growing-stock growth, removals, and mortality on timberland, Minnesota, 1977-1989.

- Current annual growth of growing stock on timberland was 451.3 million cubic feet in 1989, 2.9 percent of the 1990 inventory. Current growth for 1989 was 30.6 cubic feet per acre, 23 percent higher than average annual growth. Current annual growth per acre may be higher than average annual growth due to the accelerating growth of young stands now replacing the slowing growth of decadent old stands.
- Total current annual removals of growing stock on timberland in 1988 came to 260.8 million cubic feet. Aspen removals in 1988

Figure 8.—All live tree biomass by component, Minnesota, 1990.

totaled 144.1 million cubic feet or 5 percent more than current annual growth in 1989.

Biomass

- All live tree biomass (trees at least 1 inch in diameter) on timberland averaged 59.8 green tons per acre in 1990. Seventy-one percent of the live tree biomass was in growing-stock trees. Cull trees accounted for 13.4 percent of the biomass, and trees between 1 and 5 inches in diameter accounted for the remaining 15.6 percent (fig. 8).
- The average biomass of tall and low shrubs (including trees less than 1 inch d.b.h.) in Minnesota was 2,937 pounds green weight per acre. Average biomass ranged from a high of 5,037 pounds per acre for the paper birch forest type to a low of 626 pounds per acre for the white spruce forest type.

APPENDIX

ACCURACY OF THE SURVEY

Forest Inventory and Analysis information is based on a sampling procedure designed to provide reliable statistics at the State and Survey Unit levels. Consequently, the reported figures are estimates only. A measure of reliability of these figures is given by sampling errors. These sampling errors mean that the chances are two out of three that if a 100-percent inventory had been taken, using the same methods, the results would have been within the limits indicated.

For example, the estimated growing-stock volume in the State in 1990, 15,094.0 million cubic feet, has a sampling error of ± 0.71 percent (± 107.2 million cubic feet). The growing-stock volume from a 100-percent inventory would be expected to fall between 14,986.8 and 15,201.2 million cubic feet ($15,094.0 \pm 107.2$), there being a one in three chance that this is not the case.

The following tabulation shows the sampling errors for the Minnesota Forest Inventory:

Item	State totals	Sampling error
Growing-stock	(Million cubic feet)	(Percent)
Volume (1990)	15,094.0	0.71
Average annual growth (1977-1989)	367.1	1.30
Average annual removals (1977-1989)	207.6	4.86
Sawtimber	(Million board feet)	
Volume (1990)	34,810.5	1.02
Average annual growth (1977-1989)	1,310.4	1.45
Average annual removals (1977-1989)	515.4	6.03
Timberland area (1990)	(Thousand acres) 14,773.4	0.36

As survey data are broken down into sections smaller than State totals, the sampling error increases. For example, the sampling error for timberland area in a particular county is higher than that for total timberland area in the State. This tabulation shows the sampling errors for

State totals. To estimate sampling error for data smaller than State totals, use the following formula:

$$E = \frac{(SE) \sqrt{(\text{State total volume or area})}}{\sqrt{(\text{Volume or area smaller than State total})}}$$

where:

E = sampling error in percent
SE = State total error for volume or area

For example, to compute the error on the area of timberland in the aspen type for the State, proceed as follows:

The total area of aspen type in the State from table 3 = 5,114,200 acres

The total area of all timberland in the State from table 3 = 14,773,400 acres

The State total error for timberland area from the above tabulation = 0.36 percent

Using the above formula:

$$\begin{aligned} \text{Error} &= \frac{(0.36) \sqrt{14,773,400}}{\sqrt{5,114,200}} \\ &= \pm 0.61 \text{ percent} \end{aligned}$$

County Data

A standard FIA inventory is designed to provide sampling errors of 3 percent per million acres of timberland or an overall error on Minnesota's nearly 15 million acres of about 0.36 percent. The State of Minnesota funded the collection of additional field data that would reduce the sampling error by one-half. The goal was to provide a sampling error of less than 10 percent for total timberland area by county.

The sampling error within a county depends on county size and total area of timberland. Many large, heavily forested counties in the State have sampling errors well below 5 percent. However in counties where timberland area is less than 35,000 acres, sampling errors generally exceed 10 percent. This is often the case in the Prairie and Central Hardwood Survey Units. For this reason some of the counties in these units were

grouped in this report to provide reporting areas with sampling errors of less than 10 percent (fig. 9). The sampling error for total timber volume in a reporting area containing 35,000 acres of timberland will be about 20 percent. Individual county data for the Prairie and Central Hardwood Survey Units are provided only in table 1. All other tables reporting county level information use the county or county group names displayed below.

COMPARING MINNESOTA'S FIFTH INVENTORY WITH THE FOURTH INVENTORY

The following paragraphs highlight some of the procedural changes since the last inventory to assist the reader in analyzing data from this report:

A new volume estimation procedure was developed for the Lake States (see Survey Procedures section), and this procedure was used to compute the 1989 volumes and also to recompute the 1977 volume for growth calculations. Although the adjustment will differ by Survey Unit and species, the recomputed 1977 growing-stock and board foot volumes will generally be greater than those shown in the 1977 report.

Past surveys used only growing-stock trees to determine stand-size class. Current survey procedures require that stand-size class be determined on the basis of all live trees. Therefore, direct comparisons of current inventory data to old inventory data by stand-size class may be misleading.

The basic building block for estimating forest area and timber volume has been changed from the Survey Unit to the county. In the past, the statistics were developed at the Unit level and prorated back to the county on the basis of photo-interpretation points. Direct development of county-level data helps users interested in more precise local data, but can make the outcome of comparisons with past estimates uncertain.

SURVEY PROCEDURES

The 1990 Minnesota survey used a growth model-enhanced, two-phase sample design. Using this sampling scheme and associated estimators is similar to sampling with partial replacement (SPR), in that a set of randomly located plots is available for remeasurement and a random set of new plots is established and measured. A significant feature of the new Minnesota design is stratification for disturbance on the old sample and use of a growth model to improve regression estimates made on old undisturbed forest plots (fig. 9). Detailed descriptions of the sampling and estimation

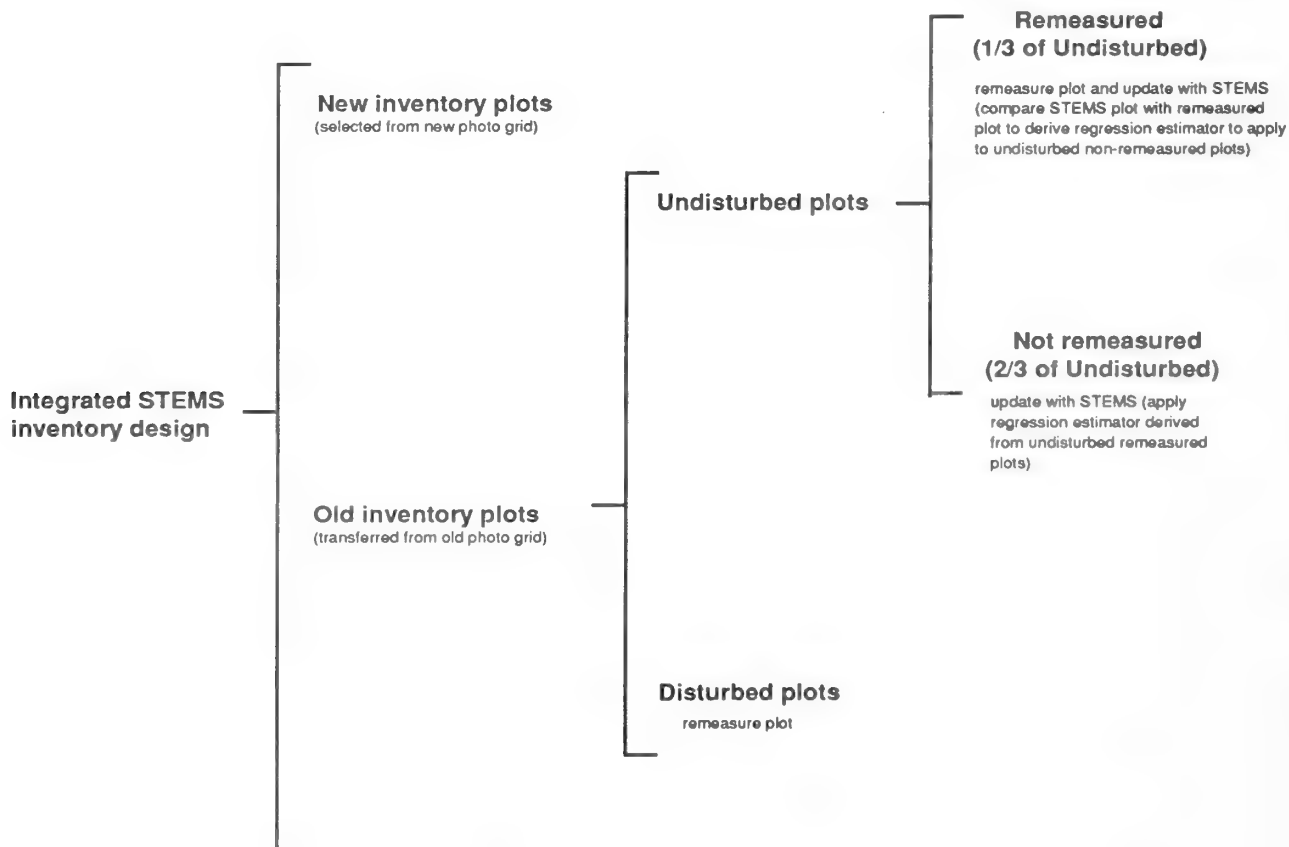

Figure 9.—Overview of the Minnesota sample design.

procedures are presented by Hansen (1990)². The growth model used in the Minnesota survey design was the Lake States Stand and Tree Evaluation and Modeling System (STEMS)³.

These were the major steps in the new survey design:

1. Aerial photography (Phase 1)

In this phase two sets of random points were located on current aerial photography. The first is a set of new photo plots and the second is a set of relocated old ground plot locations from the 1977 inventory. Photos used in the Aspen-Birch and Northern Pine Units were 1:58,000 scale color infrared National High Altitude Photo program (NHAP) prints purchased by the Minnesota Department of Natural Resources (DNR) from the U.S. Geological Survey. Aerial photos used in the Central Hardwood and Prairie Units were 1:40,000 scale black and white photos furnished by the Agricultural Stabilization and Conservation Service (ASCS). In addition, the DNR provided 35mm true color prints at a scale of 1:15,840 of all of the 1977 ground plot locations. These 35mm prints were used in addition to the NHAP prints to help detect disturbances in the 1977 ground plot locations. The dates of photography for each unit in the State are given in the next column. Dates of photography for individual counties can be found in their respective unit reports. Photo interpretation for the Aspen-Birch Unit and Northern Pine Unit was performed by the DNR. FIA photo interpreters classified the Central Hardwood and Prairie Units.

² Hansen, Mark H. 1990. *A comprehensive sampling system for forest inventory based on an individual tree growth model*. St. Paul, MN: University of Minnesota, College of Natural Resources. 256 p. Ph.D. dissertation.

³ Belcher, David W.; Holdaway, Margaret R.; Brand, Gary J. 1982. *A description of STEMS the stand and tree evaluation and modeling system*. Gen. Tech. Rep. NC-79. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 18 p.

Unit	Date	
	NHAP or ASCS	35mm
Aspen-Birch	1981-1984	1986-1987
Northern Pine	1981-1985	1985-1989
Central Hardwoods	1976-1984	1988
Prairie	1978-1982	1988

The locations of the plots used in the 1977 inventory were transferred to these new photographs. The photographs were then assembled into township mosaics, and a systematic grid of 121 one-acre photo plots (each plot representing approximately 190.4 acres) was overlaid on each township mosaic. Each of these photo plots was examined by aerial photogrammetrists and classified stereoscopically based on land use. If trees were present, forest type and stand-size/density class were recorded. All of the 1977 ground plot locations were also examined for disturbance (logging, fire, catastrophic mortality, etc.) with the aid of the 35mm photographs. After this examination, all the old "disturbed" sample locations and one-third of the old "undisturbed" forested plots were sent to the field for survey crews to verify the photo classification and to take further measurements. All photo plot locations for the 1990 inventory were examined and were classified as shown in the following tabulation:

Photo land class	Photo plots
Timberland	73,506
Reserved forest land	5,906
Other forest land	5,918
Questionable	2,876
Nonforest with trees	4,503
Nonforest without trees	174,934
Water	16,777
All classes	284,420

2. Plot measurements (Phase 2)

On plots classified as timberland, wooded pasture, or windbreak (at least 120 feet wide), a ground plot was established, remeasured, or modeled. Old plots sent to the field for remeasurement that could not be relocated were replaced with a new plot at the approximate

location of the old one. Each ground plot consists of a 10-point cluster covering approximately 1 acre. At each point, trees 5.0 inches or more in d.b.h. were sampled on a 37.5 Basal Area Factor (BAF) variable-radius plot, and trees less than 5.0 inches d.b.h. were sampled on a 1/300-acre fixed-radius plot. The measurement procedures for the new and old sample locations were as follows:

a. New inventory plots

A random sample of the new photo plots was selected for field measurement. Ground plots were established, and measures of current classification such as land use, forest type, and ownership as well as size and condition of all trees on the plot were recorded. These locations were monumented for future remeasurement.

b. Old inventory plots

These plots were established, monumented, and measured as part of the 1977 field inventory. The procedures for these old plots were different from those for the new plots. Old plots were classed as "undisturbed" or "disturbed" in the aerial photo phase of the sampling process. All disturbed plots and a one-third sample of the undisturbed forested plots were remeasured to obtain estimates of current condition and changes since the last inventory. All trees measured on these plots in 1977 were remeasured or otherwise accounted for, and all new trees were identified and measured.

All sample plots that were forested at the time of the 1977 inventory and determined to be undisturbed until this inventory were projected to the current time using STEMS. This procedure gives projected estimates of current volume and growth for these undisturbed plots. The comparison of the projected and observed values on the one-third sample of the undisturbed forest plots that were remeasured provided local calibration data to adjust the projected values of the undisturbed plots that were not remeasured. The adjustment procedure is a modified version of the method described by Smith⁴.

In the Aspen-Birch and Northern Pine Units, plots that were classified in Phase 1 as undisturbed nonforest were visually inspected from fixed wing aircraft to verify this classification. If the spotter felt the photo interpreter had misclassified the plot, the plot was ground checked by a field crew.

The undisturbed forested plots that were not remeasured played a crucial role in the new survey design. These plots, after careful examination comparing past and current aerial photography, were determined to be undisturbed and had conditions that could be simulated by STEMS. The STEMS growth model was used to "grow" the old plot and tree data to produce an estimate of current data. Thus, these plots were treated as ground plots, even though they were never visited. The plot record for each modeled plot was sent to the field for verification of current ownership information.

All old plots classified as disturbed were sent to the field for remeasurement to assess and verify changes since the last inventory. Disturbance refers to any change on a plot that can be detected on aerial photos and that the STEMS growth processor cannot predict, such as catastrophic mortality, cutting, seedling stands, and land use change.

The estimation procedure for computing statistics from this sampling design was more complicated than the simple two-phase estimation procedure used in the past. In fact, this procedure yielded two independent samples, one coming from the new photo points and the other from the old photo points that are remeasured or modeled. The tabulation on the next page summarizes the distribution of all ground plots for the new inventory design by type of plot:

⁴ Smith, W. Brad. 1983. *Adjusting the STEMS regional growth models to improve local predictions*. Res. Note NC-297. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 5 p.

Ground land use class	Old plots remeasured	Old plots updated	New plots	Total plots
Timberland	6,430	2,962	2,726	12,118
Reserved forest land	27	20	630	677
Other forest land	250	424	149	823
Nonforest with trees	462	92	127	681
Nonforest without trees	8,357	14,994	3,991	27,342
Water	583	1,050	685	2,318
Total	16,109	19,542	8,308	43,959

3. Area estimates

Area estimates were made using two-phase estimation methods. In this type of estimation, a preliminary estimate of area by land use is made from the aerial photographs (Phase 1) and corrected by the plot measurements (Phase 2). A complete description of this estimation method is presented by Loetsch and Haller (1964)⁵.

4. Volume estimates

Estimates of volume per acre were made from the trees measured or modeled on the 10-point plots. Estimates of volume per acre were multiplied by the area estimates to obtain estimates of total volume. Net cubic foot volumes are based on a modification of the method presented by Hahn (1984)⁶ for use in the Lake States. For the Minnesota inventory, the merchantable height equation presented was used in conjunction with Stone's equation to estimate gross volume. This estimate was then corrected by species for variation in bark and cull volume to yield an estimate of net volume.

The Forest Service reports all board foot volume in International 1/4-inch rule. In Minnesota,

the Scribner log rule is commonly used. Scribner log rule conversion factors were derived from full tree measurements taken throughout the Lake States (Michigan, Wisconsin, and Minnesota) and an equation developed by Wiant and Castenaeda (1977)⁷. The factors (multipliers) used here to convert board foot International volumes to the Scribner rule are shown in the following tabulation:

D.b.h. (inches)	Scribner rule conversion factor	
	Softwoods	Hardwoods
9.0-10.9	0.7830	—
11.0-12.9	.8287	0.8317
13.0-14.9	.8577	.8611
15.0-16.9	.8784	.8827
17.0-18.9	.8945	.8999
19.0-20.9	.9079	.9132
21.0-22.9	.9168	.9239
23.0-24.9	.9240	.9325
25.0-26.9	.9299	.9396
27.0-28.9	.9321	.9454
29.0+	.9357	.9544

5. Growth and mortality estimates

On remeasured plots, estimates of growth and mortality per acre come from the remeasured diameters of trees and from observation of trees that died between inventories. Growth reported as the average net annual growth between the two inventories (1977 and 1990) is computed from data on remeasurement plots and modeled

⁵ Loetsch, F.; Haller, K.E. 1964. *Forest inventory, volume 1, statistics of forest inventory and information from aerial photographs*. BLV Verlagsgesellschaft Munch Basle Vienna. 436 p.

⁶ Hahn, Jerold T. 1984. *Tree volume and biomass equations for the Lake States*. Res. Pap. NC-250. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 10 p.

⁷ Wiant, Harry V., Jr.; Castenaeda, Froylan. 1977. *Mesavage and Girard's volume tables formulated*. BLM4. Denver, CO: U.S. Department of Interior, Bureau of Land Management, Denver Service Center: 1-4.

plots using methods presented by VanDeusen *et al.* (1986)⁸. Mortality is also average net annual for the remeasurement period. On new plots, where trees were not remeasured, estimates of growth and mortality were obtained by using STEMS to project the growth and mortality of trees for 1 year. Growth and mortality estimates for old undisturbed plots that were updated were derived in the same manner as remeasured plots. The STEMS growth model was adjusted by Survey Unit to meet local conditions, using data from the undisturbed remeasurement plots. As with volume, total growth and mortality estimates were obtained by multiplying the per acre estimates by area estimates. Current annual growth for 1989 was computed by using the adjusted STEMS model to grow all current inventory plots for 1 year.

6. Average annual removals estimates

Average annual growing-stock and sawtimber removals (1977 to 1989) were estimated only from the remeasured plots; new plots were not used to estimate removals. These estimates are obtained from trees measured in the last survey and cut or otherwise removed from the timberland base. Because remeasurement plots make up about one-half of the total ground plots, average annual removals estimates have greater sampling errors than volume and growth estimates.

Tree Grade

All sawtimber sample trees were graded for quality and assigned a tree grade on approximately one-third of the sample plots in Minnesota. Tree grades are based on the classification of external characteristics as indicators of quality. The volume yield by tree grade for this sample was used to distribute the volume of the ungraded sample trees by species group.

⁸ VanDeusen, P.C.; Dell, T.R.; Thomas, C.E. 1986. Volume growth estimation from permanent horizontal points. *Forest Science*. 32: 415-422.

Hardwood sawtimber trees were graded according to "Hardwood tree grades for factory lumber."⁹ The best 12-foot section of the lowest 16-foot hardwood log was used for grading. Hardwood sawtimber trees that did not meet minimum tree grade specifications for grades 1 through 3 were assigned grade 4 according to Forest Service standard specifications for hardwood construction logs described in "A guide to hardwood log grading."¹⁰

Red pine and jack pine sawtimber trees were graded based on specifications described in "Forest Service log grades for southern pines."¹¹ White pine and other softwood sawtimber trees were graded according to specifications described in the circular "Log Grades"¹² from the University of Wisconsin. For all softwoods, the first merchantable 16-foot log, or shorter lengths down to 12 feet, was used for grading.

Hardwood Tree Grades for Factory Lumber

Grade factor	Tree grade 1	Tree grade 2	Tree grade 3
Length of grading zone (feet)	Butt 16	Butt 16	Butt 16
Length of grading section ^a (feet)	Best 12	Best 12	Best 12
DBH, minimum (inches)	16 ^b	13	11
Diameter, minimum inside bark at top of grading section (inches)	13 ^b 16 20	11 ^c 12	8
Clear cuttings (on the three best faces) ^d			
Length, minimum (feet)	7 5 3	3 3	2
Number on face (maximum)	2	2 3	e
Yield in face length (minimum)	5/6	4/6	3/6
Cull deduction (including crook and sweep, but excluding shake) maximum within grading section (percent)	9	9 ^f	50

^a Whenever a 14- or 16-foot section of the butt 16-foot log is better than the best 12-foot section, the grade of the longer section will become the grade of the tree. This longer section, when used, is the basis for determining the grading factors such as diameter and cull deduction.

^b In basswood and ash, DIB at top of grading section must be 12 inches and DBH must be 15 inches.

^c Grade 2 trees can be 10 inches DIB at top of grading section if otherwise meeting surface requirements for small grade 1's.

^d A clear cutting is a portion of a face free of defects, extending the width of the face. A face is one-fourth of the surface of the grading section as divided lengthwise.

^e Unlimited.

^f Fifteen percent crook and sweep or 40 percent total cull deduction are permitted in grade 2, if size and surface of grading section qualify as grade 1. If rot shortens the required clear cuttings to the extent of dropping the butt log to grade 2, do not drop the tree's grade to 3 unless the cull deduction for rot is greater than 40 percent.

Forest Service Standard Specifications for Hardwood Construction Logs (tie and timber logs)¹

Position in tree	Butts and uppers
Min. diameter, small end	8 inches +
Min. length without trim	8 feet
Clear cuttings	No requirements
Sweep allowance	One-fourth of the diameter at the small end for each 8 feet of length.
Sound surface defects:	
Single knots	Any number, if no one knot has an average diameter above the callus in excess of one-third of the log diameter at point of occurrence.
Whorled knots	Any number, if the sum of knot diameters above the callus does not exceed one-third of the log diameter at point of occurrence.
Holes	Any number, provided none has a diameter over one-third of the log diameter at point of occurrence and none extends more than 3 inches into included timber ² .
Unsound surface defects :	Same requirements as for sound defects if they extend into included timber. No limit if they do not.

¹*These specifications are minimum for the class. If, from a group of logs, factory logs are selected first, thus leaving only nonfactory logs from which to select construction logs, then the quality range of the construction logs so selected is limited, and the class may be considered a grade. If selection for construction logs is given first priority, it may be necessary to subdivide the class into grades.*

²*Included timber is always square, and dimension is judged from small end.*

Tree Grades for Eastern White Pine

Log grade	Minimum size ¹		Sweep or crook allowance	Total cull allowance including sweep	Maximum weevil injury	Allowable knot size (inches) ² on three best faces or minimum clearness on four faces
	Diameter (Inches)	Length (Feet)	(Percent)	(Percent)	(Number)	(Inches)
1	12 & 13	8-16	20	50	0	Four faces clear full length
	14+	10-16	20	50	0	Two faces clear full length, or four faces clear 50 percent length (6 feet min. length) ³
2	6+	8-16	30	50	0	Sound knots i.e. ⁴ D/6 and less than 3 inches ⁵ Unsound knots: i.e. 1-1/2 inches and for: butt, logs i.e. D/12 upper logs i.e. D/10, or four faces clear 50 percent of length
3	6+	8-16	40	50	8-foot logs: 1 weevil	Sound knots i.e. D/3 and less than 5 inches
					10-foot+ logs: 2 weevils	Unsound knots i.e. D/6 and less than 2-1/2 inches
4	6+	8-16	50	50	No limit	No limit

¹Plus trim.

²Disregard all knots less than one-half-inch diameter in all grades.

³The sum of the diameter of sound knots plus twice the sum of the diameter of unsound knots (in inches) is less than or equal to half of the diameter of the log (inches).

⁴I.e. means less than or equal to.

⁵D means DIB of log at location of knot.

Tree Grades for Jack Pine and Red Pine

Grade 1: Trees with three or four clear faces on the 16-foot grading section.¹

Grade 2: Trees with one or two clear faces on the 16-foot grading section.

Grade 3: Trees with no clear faces on the 16-foot grading section.

After the tentative grade is established from above, the tree will be reduced one grade for each of the following, except that no tree can be reduced below grade 3, provided the total scaling deductions for sweep and/or rot do not exceed two-thirds of the gross scale of the tree.

1. *Sweep.* Degrade any tentative grade 1 or 2 tree one grade if sweep in the lower 12 feet of grading sections amounts to 3 or more inches and equals or exceeds one-fourth of the diameter at breast height.

2. *Heart rot.* Degrade any tentative grade 1 or 2 tree one grade if conk, punk knots, massed hyphae, or other evidence of advanced heart rot is found anywhere on the main tree stem.

¹A face is one-fourth of the circumference in width extending the full length of the grading section. Clear faces are those free of: knots measuring more than one-half-inch in diameter, overgrown knots of any size, and holes more than one-fourth-inch in diameter. Faces may be rotated to obtain the maximum number of clear ones on the grading section.

Tree Grades for All Other Softwood Logs

Grade 1

1. Trees must be 16 inches in diameter or larger, grading section 12 feet in length or longer, and with deduction for defect not over 30 percent of gross scale.
2. Trees must be at least 75 percent clear on each of three faces.
3. All knots outside clear cutting must be sound and not more than 2-1/2 inches in size.

Grade 2

1. Trees must be 12 inches in diameter or larger, grading section 12 feet in length or longer, and with a net scale after deduction for defect of at least 50 percent of the gross scale deducted for defect.
2. Trees must be at least 50 percent clear on each of three faces or 75 percent clear on two faces.

Grade 3

1. Trees must be 6 inches in diameter or larger, grading section 12 feet in length or longer, and with a net scale after deduction for defect of at least 50 percent of the gross contents of the log.

Note: A) Diameters are diameter inside bark (DIB) at small end of grading section.
B) Percent clear refers to percent clear in one continuous section.

METRIC EQUIVALENTS OF UNITS USED IN THIS REPORT

- 1 acre = 4,046.86 square meters or 0.405 hectare.
 1,000 acres = 405 hectares.
 1 cubic foot = 0.0283 cubic meter.
 1 foot = 30.48 centimeters or 0.3048 meter.
 1 inch = 25.4 millimeters, 2.54 centimeters, or 0.0254 meter.
 1 pound = 0.454 kilograms.
 1 ton = 0.907 metric tons.

TREE SPECIES GROUPS IN MINNESOTA¹³

SOFTWOODS

- Eastern white pine *Pinus strobus*
 Red pine *Pinus resinosa*
 Jack pine *Pinus banksiana*
 White spruce *Picea glauca*
 Black spruce *Picea mariana*
 Balsam fir *Abies balsamea*
 Tamarack *Larix laricina*
 Northern white-cedar *Thuja occidentalis*
 Other softwoods:

- Eastern redcedar *Juniperus virginiana*
 Scotch pine *Pinus sylvestris*
 Ponderosa pine *Pinus ponderosa*

HARDWOODS

- White oak¹⁴
 White oak *Quercus alba*
 Bur oak *Quercus macrocarpa*
 Swamp white oak *Quercus bicolor*
 Red oak¹⁴
 Northern red oak *Quercus rubra*
 Northern pin oak *Quercus ellipsoidalis*
 Black oak *Quercus velutina*
 Hickory¹⁴
 Shagbark hickory *Carya ovata*
 Bitternut hickory *Carya cordiformis*

¹³ The common and scientific names are based on: Little, Elbert L. 1981. Checklist of native and naturalized trees of the United States. Agric. Handb. 541. Washington, DC: U.S. Department of Agriculture, Forest Service. 385 p.

¹⁴ This species or species group is considered a hard hardwood, with an average specific gravity greater than or equal to 0.50.

¹⁵ This species or species group is considered a soft hardwood, with an average specific gravity of less than 0.50.

- Yellow birch¹⁵ *Betula alleghaniensis*
 Hard maple¹⁴
 Black maple *Acer nigrum*
 Sugar maple *Acer saccharum*
 Soft maple¹⁵
 Red maple *Acer rubrum*
 Silver maple *Acer saccharinum*
 Ash¹⁴
 Black ash *Fraxinus nigra*
 Green ash *Fraxinus pennsylvanica*
 White ash *Fraxinus americana*
 Balsam poplar¹⁵ *Populus balsamifera*
 Aspen¹⁵
 Bigtooth aspen *Populus grandidentata*
 Quaking aspen *Populus tremuloides*
 Cottonwood¹⁵ *Populus deltoides*
 Basswood¹⁵ *Tilia americana*
 Black walnut¹⁴ *Juglans nigra*
 Black cherry¹⁵ *Prunus serotina*
 Butternut¹⁵ *Juglans cinerea*
 Elm
 American elm¹⁵ *Ulmus americana*
 Siberian elm¹⁵ *Ulmus pumila*
 Slippery elm¹⁵ *Ulmus rubra*
 Rock elm¹⁴ *Ulmus thomastii*
 Paper birch¹⁵ *Betula papyrifera*
 River birch¹⁵ *Betula nigra*
 Hackberry¹⁵ *Celtis occidentalis*
 Black willow¹⁵ *Salix nigra*
 Other hardwoods
 Boxelder¹⁵ *Acer negundo*
 Kentucky coffeetree¹⁴ *Gymnocladus dioica*
 Black locust¹⁴ *Robinia pseudoacacia*
 Red mulberry¹⁵ *Morus rubra*
 Honeylocust¹⁴ *Gleditsia triacanthos*
 Northern catalpa¹⁴ *Catalpa speciosa*
 Noncommercial species
 Striped maple *Acer pensylvanicum*
 Mountain maple *Acer spicatum*
 Ailanthus *Ailanthus altissima*
 American hornbeam *Carpinus caroliniana*
 Hawthorn *Crataegus* spp.
 Apple *Malus* spp.
 Eastern hophornbeam *Ostrya virginiana*
 Pincherry *Prunus pensylvanica*
 Wild plum *Prunus* spp.
 Chokecherry *Prunus virginiana*
 Peachleaf willow *Salix amygdaloides*
 Mountain ash *Sorbus americana*

DEFINITION OF TERMS

Average annual removals from growing stock.—The average net growing-stock volume in growing-stock trees removed annually for forest products (including roundwood products and logging residues) and for other uses (see Other removals). Average annual removals of growing stock are reported for a period of several years (1977 to 1989 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures in Appendix).

Average annual removals from sawtimber.—The average net board foot sawtimber volume of live sawtimber trees removed annually for forest products (including roundwood products and other uses [see Other removals]). Average annual removals of sawtimber are reported for a period of several years (1977 to 1989 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures in Appendix).

Basal area.—Tree area in square feet of the cross section at breast height of a single tree. When the basal areas of all trees in a stand are summed, the result is usually expressed as square feet of basal area per acre.

Biomass.—The above-ground volume of all live trees (including bark but excluding foliage) reported in green tons. Biomass has four components:

Bole.—Biomass of a tree from 1 foot above the ground to a 4-inch top outside bark.

Tops and limbs.—Total biomass of tree from a 1-foot stump minus the bole.

1- to 5-inch trees.—Total above-ground biomass of a tree from 1 to 5 inches in diameter at breast height.

Stump.—Biomass of a tree 5-inches d.b.h. and larger from the ground to a height of 1 foot.

Commercial species.—Tree species presently or prospectively suitable for industrial wood products. (Note: Excludes species of typically small size, poor form, or inferior quality such as hophornbeam, osage-orange, and redbud.)

Cord.—One standard cord is 128 cubic feet of stacked wood, including bark and air space. Cubic feet can be converted to standard cords by dividing by 79.

County and municipal land.—Land owned by counties and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

Cull.—Portions of a tree that are unusable for industrial wood products because of rot, missing or dead material, or other defect.

Current annual growth of growing stock.—The annual change in volume of sound wood in live sawtimber and poletimber trees and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes. Current growth is based on an estimate of the current annual increment of each growing stock tree in the inventory.

Current annual growth of sawtimber.—The annual change in the volume of live sawtimber trees and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes. Current growth is based on an estimate of the current annual increment of each growing-stock tree in the inventory.

Current annual removals from growing stock.—The current net growing-stock volume in growing-stock trees removed annually for forest products (including roundwood products and logging residues) and for other uses (see Other removals). Current annual removals of growing stock are reported for a single year (1988 in this report) and are based on a survey of primary wood processing mills to determine removals for products and on information from remeasurement plots (see Survey Procedures in Appendix) to determine removals due to land use change.

Current annual removals from sawtimber.—The current net board foot sawtimber volume of live sawtimber trees removed annually for forest products (including roundwood products and other uses [see Other removals]).

Current annual removals of sawtimber are reported for a single year (1988 in this report) and are based on a survey of primary wood processing mills to determine removals for products and on information from remeasurement plots (see Survey Procedures in Appendix) to determine removals due to land use change.

Diameter class.—A classification of trees based on diameter outside bark, measured at breast height (d.b.h.). Two-inch diameter classes are commonly used in Forest Inventory and Analysis, with the even inch the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h.

Diameter at breast height (d.b.h.).—The outside bark diameter at 4.5 feet (1.37 m) above the forest floor on the uphill side of the tree. For determining breast height, the forest floor includes the duff layer that may be present, but does not include unincorporated woody debris that may rise above the ground line.

Farm.—Any place from which \$1,000 or more of agricultural products were produced and sold during the year.

Farmer-owned land.—Land owned by farm operators whether part of the farmstead or not. (Note: Excludes land leased by farm operators from nonfarm owners, such as railroad companies and States.)

Forest land.—Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, and not currently developed for nonforest use. (Note: Stocking is measured by comparing specified standards with basal area and/or number of trees, age or size, and spacing.) The minimum area for classification of forest land is 1 acre. Roadside, streamside, and shelterbelt strips of timber must have a crown width of at least 120 feet to qualify as forest land. Unimproved roads and trails, streams, or other bodies of water or clearings in forest areas shall be classed as forest if less than 120 feet wide. (See Tree, Land, Timberland, Reserved forest land, Other forest land, Stocking, and Water.)

Forest industry land.—Land owned by companies or individuals that operate a primary wood-using plant.

Forest type.—A classification of forest land based on the species forming a plurality of live tree stocking. Major forest types in the State are:

Jack pine.—Forests in which jack pine comprises a plurality of the stocking. (Common associates include eastern white pine, red pine, aspen, birch, and maple.)

Red pine.—Forests in which red pine comprises a plurality of the stocking. (Common associates include eastern white pine, jack pine, aspen, birch, and maple.)

White pine.—Forests in which eastern white pine comprises a plurality of the stocking. (Common associates include red pine, jack pine, aspen, birch, and maple.)

Balsam fir.—Forests in which balsam fir and white spruce comprise a plurality of stocking with balsam fir the most common. (Common associates include aspen, maple, birch, northern white-cedar, and tamarack.)

White spruce.—Forests in which white spruce and balsam fir comprise a plurality of the stocking with white spruce the most common. (Common associates include aspen, maple, birch, northern white-cedar, and tamarack.)

Black spruce.—Forests in which swamp conifers comprise a plurality of the stocking with black spruce the most common. (Common associates include tamarack and northern white-cedar.)

Northern white-cedar.—Forests in which swamp conifers comprise a plurality of the stocking with northern white-cedar the most common. (Common associates include tamarack and black spruce.)

Tamarack.—Forests in which swamp conifers comprise a plurality of the stocking with tamarack the most common. (Common associates include black spruce and northern white-cedar.)

Oak-hickory.—Forests in which northern red oak, white oak, bur oak, or hickories, singly or in combination, comprise a plurality of the stocking. (Common associates include jack pine, elm, and maple.)

Elm-ash-soft maple.—Forests in which lowland elm, ash, red maple, silver maple, and cottonwood, singly or in combination, comprise a plurality of the stocking. (Common associates include birches, spruce, and balsam fir.)

Maple-basswood.—Forests in which sugar maple, basswood, yellow birch, upland American elm, and red maple, singly or in combination, comprise a plurality of the stocking. (Common associates include white pine, elm, and basswood.)

Aspen.—Forests in which quaking aspen or bigtooth aspen, singly or in combination, comprise a plurality of the stocking. (Common associates include balsam poplar, balsam fir, and paper birch.)

Paper birch.—Forests in which paper birch comprises a plurality of the stocking. (Common associates include maple, aspen, and balsam fir.)

Balsam poplar.—Forests in which balsam poplar comprises a plurality of the stocking. (Common associates include aspen, elm, and ash.)

Growing-stock tree.—A live tree of commercial species that meets specified standards of size, quality, and merchantability. (Note: Excludes rough, rotten, and dead trees.)

Growing-stock volume.—Net volume in cubic feet of growing-stock trees 5.0 inches d.b.h. and over, from 1 foot above the ground to a minimum 4.0 inch top diameter outside bark of the central stem or to the point where the central stem breaks into limbs.

Hard hardwoods.—Hardwood species with an average specific gravity greater than 0.50 such as oaks, hard maple, hickories, and ash.

Hardwoods.—Dicotyledonous trees, usually broad-leaved and deciduous. (See Soft hardwoods and Hard hardwoods.)

Indian land.—Land held in trust by the United States for the tribes or individual Indians.

Land.—A. *Bureau of the Census.* Dry land and land temporarily or partly covered by water such as marshes, swamps, and river flood plains (omitting tidal flats below mean high tide); streams, sloughs, estuaries, and canals less than one-eighth of a statute mile wide; and lakes, reservoirs, and ponds less than 40 acres in area.

B. *Forest Inventory and Analysis.* The same as the Bureau of the Census, except minimum width of streams, etc., is 120 feet and minimum size of lakes, etc., is 1 acre.

Log grade.—A log classification based on external characteristics as indicators of quality or value. (See Appendix for specific grading factors used.)

Marsh.—Nonforest land that characteristically supports low, generally herbaceous or shrubby vegetation and that is intermittently covered with water.

Merchantable.—Refers to a pulpwood or saw log section that meets pulpwood or saw log specifications, respectively.

Miscellaneous Federal land.—Federal land other than National Forest and land administered by the Bureau of Land Management or Bureau of Indian Affairs.

Miscellaneous private land.—Privately owned land other than forest-industry and farmer-owned land.

Mortality.—The volume of sound wood in growing-stock and sawtimber trees that die annually.

National Forest land.—Federal land that has been legally designated as National Forest or purchase units, and other land administered by the USDA Forest Service.

Net annual growth of growing stock.—The annual change in volume of sound wood in live sawtimber and poletimber trees and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes.

Net annual growth of sawtimber.—The annual change in the volume of live sawtimber trees and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes.

Net volume.—Gross volume less deductions for rot, sweep, or other defect affecting use for timber products.

Noncommercial species.—Tree species of typically small size, poor form, or inferior quality that normally do not develop into trees suitable for industrial wood products.

Nonforest land.—Land that has never supported forests, and land formerly forested where use for timber management is precluded by development for other uses. (Note: Includes areas used for crops, improved pasture, residential areas, city parks, improved roads of any width and adjoining clearings, powerline clearings of any width, and 1- to 40-acre areas of water classified by the Bureau of the Census as land. If intermingled in forest areas, unimproved roads and nonforest strips must be more than 120 feet wide and more than 1 acre in area to qualify as nonforest land.)

a. *Nonforest land without trees.*—Nonforest land with no live trees present.

b. *Nonforest land with trees.*—Nonforest land with one or more trees per acre at least 5 inches d.b.h.

Nonstocked land.—Forest land less than 16.7 percent stocked with all live trees.

Other forest land.—Forest land not capable of producing 20 cubic feet per acre per year of industrial wood crops under natural conditions and not associated with urban or rural development. These sites often contain tree species that are not currently utilized for industrial wood production or trees of poor form, small size, or inferior quality that are unfit for industrial products. Unproductivity may be the result of adverse site conditions such as sterile soil, dry climate, poor drainage, high elevation, and rockiness. This land is not withdrawn from timber utilization.

Other removals.—Growing-stock trees removed but not utilized for products, or trees left standing but “removed” from the timberland classification by land use change. Examples are removals from cultural operations such as timber stand improvement work, land clearing, and changes in land use.

Ownership size class.—The amount of timberland owned by one owner, regardless of the number of parcels.

Ownership tenure.—The length of time a property has been held by the owner.

Physiographic class.—A measure of soil and water conditions that affect tree growth on a site. The physiographic classes are:

Xeric sites.—Very dry soils where excessive drainage seriously limits both growth and species occurrence.

Xeromesic sites.—Moderately dry soils where excessive drainage limits growth and species occurrence to some extent. Example: dry oak ridge.

Mesic sites.—Deep, well-drained soils. Growth and species occurrence are limited only by climate.

Hydromesic sites.—Moderately wet soils where insufficient drainage or infrequent flooding limits growth and species occurrence to some extent. Example: better drained bottomland hardwood sites.

Hydric sites.—Very wet sites where excess water seriously limits both growth and species occurrence. Example: frequently flooded river bottoms and cypress swamps.

Poletimber stand.—(See Stand-size class.)

Poletimber tree.—A tree of commercial species at least 5.0 inches d.b.h. but smaller than sawtimber size.

Potential productivity class.—A classification of forest lands in terms of inherent capacity to grow crops of industrial wood. The class identifies the potential growth in merchantable cubic feet/acre/year at culmination of mean annual increment of fully stocked natural stands.

Reserved forest land.—Forest land withdrawn from timber utilization through statute, administrative regulation, designation, or exclusive use for Christmas tree production, as indicated by annual shearing.

Rotten tree.—A tree that does not meet regional merchantability standards because of excessive unsound cull. May include noncommercial tree species.

Rough tree.—A tree that does not meet regional merchantability standards because of excessive sound cull. May include noncommercial tree species.

Roundwood products.—Logs, bolts, or other round sections (including chips from roundwood) cut from trees for industrial or consumer uses. (Note: includes saw logs, veneer logs and bolts; cooperage logs and bolts; pulpwood; fuelwood; pilings; poles; posts; hewn ties; mine timbers; and various other round, split, or hewn products.)

Salvable dead tree.—A standing or down dead tree considered merchantable by regional standards.

Sapling.—A live tree 1.0 to 5.0 inches d.b.h.

Sapling-seedling stand.—(See Stand-size class.)

Saw log.—A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight and with a minimum diameter outside bark (d.o.b.) for softwoods of 7.0 inches (9.0 inches for hardwoods) or other combinations of size and defect specified by regional standards.

Saw-log portion.—That part of the bole of sawtimber trees between the stump and the saw-log top.

Saw-log top.—The point on the bole of sawtimber trees above which a saw log cannot be produced. The minimum saw-log top is 7.0 inches d.o.b. for softwoods and 9.0 inches d.o.b. for hardwoods.

Sawtimber stand.—(See Stand-size class.)

Sawtimber tree.—A tree of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs 8 feet or longer, and meeting regional specifications for freedom from defect. Softwoods must be at least 9.0 inches d.b.h. Hardwoods must be at least 11.0 inches d.b.h.

Sawtimber volume.—Net volume of the saw-log portion of live sawtimber in board feet, International 1/4-inch rule (unless specified otherwise) from stump to a minimum 7.0 inches top diameter outside bark (d.o.b.) for softwoods and a minimum 9.0 inches top d.o.b. for hardwoods.

Seedling.—A live tree less than 1.0 inch d.b.h. that is expected to survive. Only softwood seedlings more than 6 inches tall and hardwood seedlings more than 1 foot tall are counted.

Short-log (rough tree).—Sawtimber-size trees of commercial species that contain at least one merchantable 8- to 11-foot saw log but not a 12-foot saw log.

Site index.—An expression of forest site quality based on the height of a free-growing dominant or codominant tree of a representative species in the forest type at age 50.

Soft hardwoods.—Hardwood species with an average specific gravity less than 0.50 such as gum, yellow-poplar, cottonwood, red maple, basswood, and willow.

Softwoods.—Coniferous trees, usually evergreen, having needles or scale-like leaves.

Stand.—A group of trees on a minimum of 1 acre of forest land that is stocked by forest trees of any size.

Stand-age class.—Age of main stand. Main stand refers to trees of the dominant forest type and stand-size class.

Stand-size class.—A classification of stocked (see Stocking) forest land based on the size class of live trees on the area; that is, sawtimber, poletimber, or seedlings and saplings.

a. *Sawtimber stands.*—Stands with half or more of live stocking in sawtimber or poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

b. *Poletimber stands.*—Stands with half or more live stocking in poletimber and/or sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

c. *Sapling-seedling stands.*—Stands with more than half of the live stocking in saplings and/or seedlings.

State land.—Land owned by States or leased to them for 50 years or more.

Stocking.—The degree of occupancy of land by live trees, measured by basal area and/or the number of trees in a stand by size or age and spacing, compared to the basal area and/or number of trees required to fully utilize the growth potential of the land; that is, the stocking standard.

A stocking percent of 100 indicates full utilization of the site and is equivalent to 80 square feet of basal area per acre in trees 5.0 inches d.b.h. and larger. In a stand of trees less than 5 inches d.b.h., a stocking percent of 100 would indicate that the present number of trees is sufficient to produce 80 square feet of basal area per acre when the trees reach 5 inches d.b.h.

Stands are grouped into the following stocking classes:

Overstocked stands.—Stands in which stocking of live trees is 133 percent or more.

Fully stocked stands.—Stands in which stocking of live trees is from 100.0 to 132.9 percent.

Medium stocked stands.—Stands in which stocking of live trees is from 60.0 to 99.9 percent.

Poorly stocked stands.—Stands in which stocking of live trees is from 16.7 to 59.9 percent.

Nonstocked areas.—Timberland on which stocking of live trees is less than 16.7 percent.

Timberland.—Forest land that is producing or capable of producing in excess of 20 cubic feet per acre per year of industrial wood crops under natural conditions, that is not withdrawn from timber utilization, and that is not associated with urban or rural development. Currently inaccessible and inoperable areas are included.

Tree.—A woody plant usually having one or more perennial stems, a more or less definitely formed crown of foliage, and a height of at least 12 feet at maturity.

Tree biomass.—The total above-ground weight (including the bark but excluding the foliage) of all trees from 1 to 5 inches in d.b.h., and the total above-ground weight (including the bark but excluding the foliage) from a 1-foot stump for trees more than 5 inches in diameter.

Tree size class.—A classification of trees based on diameter at breast height, including sawtimber trees, poletimber trees, saplings, and seedlings.

Upper stem portion.—That part of the bole of sawtimber trees above the saw-log top to a minimum top diameter of 4.0 inches outside bark or to the point where the central stem breaks into limbs.

Water.—(a) *Bureau of the Census.*—Permanent inland water surfaces, such as lakes, reservoirs, and ponds at least 40 acres in area; and streams, sloughs, estuaries, and canals at least one-eighth of a statute mile wide.

(b) *Noncensus.*—Permanent inland water surfaces, such as lakes, reservoirs, and ponds from 1 to 39.9 acres in area; and streams, sloughs, estuaries, and canals from 120 feet to one-eighth of a statute mile wide.

Wooded strip.—An acre or more of natural continuous forest land that would otherwise meet survey standards for timberland except that it is less than 120 feet wide.

Miles, Patrick D.; Chen, Chung M.

1992. **Minnesota forest statistics, 1990.** Resour. Bull. NC-141. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 130 p.

The fifth inventory of Minnesota's forests reports 51.0 million acres of land, of which 16.7 million acres are forested. This bulletin presents statistical highlights and contains detailed tables of forest area, as well as timber volume, growth, removals, mortality, and ownership.

KEY WORDS: Forest area, timber volume, growth, removals, mortality.

Our job at the North Central Forest Experiment Station is discovering and creating new knowledge and technology in the field of natural resources and conveying this information to the people who can use it. As a new generation of forests emerges in our region, managers are confronted with two unique challenges: (1) Dealing with the great diversity in composition, quality, and ownership of the forests, and (2) Reconciling the conflicting demands of the people who use them. Helping the forest manager meet these challenges while protecting the environment is what research at North Central is all about.
